Haida Pronouns - Hydaburg Dialect

Robert Welsch
University of Washington

Introduction

Since Swanton published a linguistic account of the Haida language spoken on the Queen Charlotte Islands of British Columbia, three dialects have been generally acknowledged. These are the Masset, Skidegate and Ninstints dialects. There is no published account of Ninstints which has no known living speakers. The other two dialects are primarily spoken in the towns for which the dialects were named, both of which are on Graham Island. According to Swanton (1911:209), the Haida who live in Alaska on Prince of Wales Island speak Masset dialect.

Swanton points out that a large number of Haidas moved from the northwestern Queen Charlotte Islands to Alaska around 1700-1760. At the time he was studying the Haida, these Alaskan Haida, sometimes referred to as Kaigani, were living in three villages. About 1911 the Christian community of Hydaburg was formed when the residents of Howkan, Klinkwan and Kasaan were brought together. Haida as spoken by residents of Hydaburg appears to differ from the Masset dialect reported by Swanton. It is difficult to determine at this time whether such changes are currently reflected in Masset speech or whether differences are part of a larger dialectal drift which has occurred within the last century. Despite Swanton's claims, it remains to be seen whether Kaigani speech was
identical with Masset even at the turn of this century.

This paper is an attempt to describe the pronoun system of Haida now in use in Hydaburg and to make a preliminary analysis of the changes which seem to have occurred since the accounts of Swanton and Harrison (1895). References to Haida will be to Hydaburg dialect unless otherwise specified.

**Pronoun Types**

Pronouns occur in three syntactic relationships within the Haida sentence, as subjects of predication, as objects of predication, and to denote possession. These correspond to Harrison's three relations of nominative, accusative and genitive, which are clearly modeled on Latin grammar (1895:131 ff., 135). However, Haida pronouns are not used in precisely the Indo-European sense of nominative and accusative as Harrison's grammar suggests. Broadly characterized, there are two classes of pronouns used as subjects of predication. I refer to these as active and inactive.

Generally, inactive pronouns are used with predicates denoting states of being, quality or condition. Active pronouns are used with verbs of motion or activity as well as many transitive verbs. There may be a small class of neutral verbs which also take active pronouns (cf. Eastman, Welsch and Vaughan 1975).

Verbs which are transitive in English may take either class of pronoun subject depending upon what the predication denotes, action or condition. Thus, "I am eating fish" and "I am going out" will take active pronouns, but "I am fat" and "I love my wife" (i.e., "I am in the state of loving my wife") will take inactive
The distinction between active and inactive pronouns corresponds closely, but not identically, to what Swanton (1911:256) has called subjective and objective series of pronouns.

The subjective series is used as subject of the transitive verb and of active verbs, even when there is no object expressed. Objective pronouns are used to express the subject of verbs expressing states and qualities.

Table 1 lists the forms of the two series of Masset pronouns given by Swanton. Table 2 lists Harrison's three nominative pronoun forms. Harrison suggests that Series A and B may be used interchangeably.

The single emphatic form of Swanton's subjective series (2nd sing.) is reflected throughout the active series of pronouns in Hydaburg. These contrast with a full set of non-emphatic active forms, and both sets appear to be derivationally related. I have referred to them as declarative and emphatic. Choice of an emphatic or declarative pronoun seems to be conditioned solely by the focus of the sentence. Focus is also reflected in the word order when objects are expressed. There are the following contrasting word orders for active verbs with pronoun subjects:

(obj.) + declar. pronoun subj. + pred. stem + tense/aspect suff.
emph. pronoun subj. + (obj.) + pred. stem + tense/aspect suffixes

Focus falls in both cases upon the first element of the sentence.

An arrangement of Haida pronouns from our data appears in Table 3. There are, in addition, several demonstrative or deictic pronouns which will be discussed later in this paper.

With the exception of the 1st singular possessive giagan, it appears that all the possessives, objects and inactive pronouns may be derivationally related. Indeed, with the exception of the 1st person forms, all of the pronoun series seem derivationally related.

1st Singular (Active Series)
(1) cin a̓ː təgən  I am eating fish.
    cin (fish) ta (to eat)
(2) ła̓o cin təgən  I am eating fish.
    ła̓o (emphatic pronoun)
(3) ła̓o gutəgən  I am eating.
    gu (intransitivizing particle)
(4) a̓ːl̓ gutəgən  I am eating.

Neutral verbs taking gu do not always take emphatic pronouns, though there is a tendency to do so (cf. Eastman, Welsch and Vaughan 1975). There is reason to interpret gu as an indefinite pronoun but it appears an object or as a relative pronoun (cf. Edwards 1975).

a̓ːl frequently contracts to ə and usually merges with the prior syllable. In such instances the pronoun is never stressed though the preceding syllable may receive stress on its own accord. This merging does not appear to be distinctive as (1) above may occur as:

(5) cinə təgən  I am eating fish.

There are two stresses in (5) and three in (1). These seem to be in free variation and determined by speaking speed. The contraction

...
may occur with preceding vowels as well.

(6) dala da?an

I have money.

dala (money)

There are also examples in which the declarative pronoun ı may be seen to have merged with the subsequent syllable.

(7) qa?idunsan

I will go.

qait (to go)

Harrison (1895:135) mentions a pronoun ou which he glosses as "it." Since he gives no examples of its use, it is difficult to understand precisely its grammatical significance. There is a particle with the same phonological shape in Hydaburg speech which frequently follows nouns and pronouns.

(8) cin u dün tagan

You ate the fish.

It is uncertain at this time how to gloss the particle, though it seems to indicate an added emphasis. Probably a gloss of "is the one" or "is what" is most appropriate, though it is usually not necessary to translate it.

As I have noted the underlying form of the 1st singular declarative pronoun ı is frequently realized as ı. In cases where the particle u precedes ı, contraction occurs, the pronoun retaining its stress. Thus:

\[ \text{cin u á tagən} \rightarrow \text{cin ú tagən} \]

1st Singular (Inactive Series)

(9) di qaskit lagən

I am pretty.

(10) di lamgataŋ

I am drunk.

łamga (to be drunk)
I am slim.

I like to drink whiskey.

In (10) and (11) there is a simple attribution involved. Verbs which take di may, however, take objects but the sentence must denote a condition, state of being or quality. In such cases, word order is identical with that of declarative-active sentences.

3rd Person

Gender is not marked in Haida pronouns. In addition there seems to be no distinction between singular and plural personal pronouns in the 3rd person; plurality is marked by an aspectual suffix of the verb (cf. Eastman, Welsch and Vaughan 1975).

Harrison (1895:158) notes the use of the 3rd singular pronoun for 3rd plural "if only a few persons, places or articles are referred to." Both Harrison (1895:158) and Swanton (1911:256) note the presence of a 3rd plural pronoun, distinct from 3rd singular, but I have recorded no instances of a 3rd plural form.

Emphatic - Active Pronouns

The following are examples of the emphatic pronouns:

I am dancing.

You (sing.) are going to dance.

You eat. Are you eating?

He is going to dance.

We are going to dance.
(19) 幺么 wa±uwan u k?ejaUnsan  You are all going to sing.
     么么 (2nd pl.) wa±uwan (all)

(20) lao hiajwansan  They are going to dance.

It is possible that the emphatic pronouns are morphologically complex. They may contain an underlying emphatic pronoun form plus an emphatic particle Ṽ. Thus we would find:

la + Ṽ → lao
da + Ṽ → dao
la + Ṽ → lao
lun + Ṽ → kunwu

This interpretation is supported by (16) above where the emphatic form is da rather than dao.

Neutral verbs (e.g., guta "to be eating") as well as intransitive active may take either form of the active pronoun subject. This is especially true of the 3rd person.

(21) lao gutaŋŋ  He is eating
     lao (emphatic pronoun)

(22) hU lao gutaŋŋ  He is eating.
     hU (declarative pronoun)

(21) above seems to carry with it greater emphasis on the pronoun subject as the focus of the sentence.

     Focus is better understood with another example.

(1) cin aŋŋ tagaŋŋ  I am eating fish.
     aŋŋ (declarative pronoun)

(2) lao cin tagaŋŋ  I am eating fish.
     lao (emphatic pronoun)
Typically (2) is the response to a question like "What are you doing?" (1) is a better response to "What are you eating?" In fact, Haida speakers often gloss (1) as "Fish, I am eating."

Another example of this is:

(23) 1q'ingən gwa  
I am looking at it.

(23) q'in (to look)

This verb usually takes an object but in this case the object is implied by the use of the declarative pronoun.

Declarative - Active Pronouns

(24) gusu  dUn  Isdaŋ  
What are you doing?

(25) cin  u  dUn  tagəŋ  
You (sing.) are eating the fish.

(26) k'iu  kUl  tagəŋ  
We are eating clams.

(27) kekgai  t?alUŋ  tagəŋ  
We already ate the cake.

(28) la  t?əl  q'ingən  
We saw him.

(29) kek  l  tagəŋ  
He is eating cake.

(30) kek  l  tawan  
They are eating cake.

(31) cin  ul  tawan  
They are eating the fish.

The 2nd singular dUn varies with dUn according to environment.

\[ dUn \rightarrow dUn / \_ \_ + C^{\text{voiceless }} + \text{alveolar} \]

The 3rd person declarative pronoun is realized in several surface shapes. These all derive from an underlying form hUl which is often heard as həl. As with the 1st singular form, contraction
is frequent, producing ١٠ or ١. This form generally stands alone receiving its own stress. When the particle ١ is in the environment assimilation usually occurs, especially in rapid speech.

\[
\text{u} + \text{ح١} \rightarrow \text{u} + \?١ \rightarrow \text{١}
\]

The 1st person plural form is somewhat of an anomaly since it takes either of two underlying forms, ٤٢٢٠ and ٠٢٨٢. ٤٢٢٠ seems to be a contraction of ٤٢٢٠. Some speakers use either of these forms of ٤٢٢٠ while others use only ٠٢٨٢.

Inactive Pronouns

1st person pronouns are the distinctive members of this class, apparently being unrelated to their active counterparts. 2nd and 3rd person pronouns are generally very similar to the active series forms.

(32) \text{di qaskit lagً٨} I am pretty.
(33) \text{دً٨ qaskit lagً٨} You (sing.) are pretty.
(34) \text{دً٨ kaihشٚ٦} You (sing.) are getting fat.
(35) ١ hai ٝ٨٥٧ He is getting fat.
(36) ١ hai ٝ٨٥٧ They are getting fat.
(37) ١٠ hai ٝ٨٥٧ We are getting fat.
(38) \text{ح١ qaskit lagً٨} She is pretty.
(39) \text{ح١٠ qaskit lagً٨} You (plural) are pretty.

The shape of the 2nd singular form is determined by environment.

\[
\text{دً٨٥٧} \rightarrow \text{دً٨} / \_\_\_ + [^\text{+stop}] + [^\text{+post-palatal}]
\]
Demonstrative or Deictic Pronouns

Though my data is incomplete, Kaigani Haida appears to have three demonstrative pronouns.

(40) anIs This one.
(41) hUnIs That one.
(42) wUnIs That one over there.

Robert Levine (personal communication) has referred to cognate forms in Skidegate Dialect as deictic pronouns. Their use in Hydaburg is similar to English demonstratives, except that there are three distances implied. When used to refer to people they may stand alone.

(43) anIs kukujangən This one is smoking.
(44) hUnIs cin tagən That one was eating fish.
(45) wUnIs hialgən That one (over there) is dancing.

These three forms contrast with lao and hUl.

Used with nouns they act as deictic adjectives.

(46) anIs qidai jingən This tree is tall.
(47) hUnIs qidai skəpjugən That tree is bent over.

Harrison (1895:136) notes only two forms anIs and wUnIs and remarks that these are used only with persons. In addition to these, he lists several impersonal demonstratives, but I have not dealt with them here.

anIs, hUnIs and wUnIs are probably morphologically complex; they seem to have plural forms and be related to several adverbs.

(48) hU̲das Those ones.
(49) hU̲kin There.
Pronoun Objects

Pronoun objects are related to the inactive series. I have no instances of 2nd plural or 1st plural forms, but this is likely an omission in the data.

(54) la di quiada
I love him.
la (him) di (I)

(55) di ḫal di quiadəŋ
My husband loves me.
di (me) ḫal di (my husband)

(56) la aŋ gusuʔəŋ
I'm talking to them.
la (them) gusu (to talk)

(57) ada:l dünk ħ qịʔəsan
I'll see you tomorrow.
ada:l (tomorrow)

Possessive Pronouns

Swanton gives the following possessive pronouns for Masset (1911:257):

(58) ḡi:`na
my

(59) dA:`ña
thine

(60) ḡa:`ña
his

(61) i`lana
our

(62) Li`ña
Their

The forms which Harrison cites as possessives are given in Table 4.
Table 4. Masset Possessives, After Harrison (1895:136).

<table>
<thead>
<tr>
<th></th>
<th>General</th>
<th>Definite</th>
<th>Reflexives</th>
</tr>
</thead>
<tbody>
<tr>
<td>my</td>
<td>Dī</td>
<td>Dīnā</td>
<td>Giang</td>
</tr>
<tr>
<td>your</td>
<td>Dung</td>
<td>Dāngā</td>
<td>Dungīou</td>
</tr>
<tr>
<td>his, hers</td>
<td>Il</td>
<td>Langa</td>
<td>Lāgiou</td>
</tr>
<tr>
<td>ours</td>
<td>Ītil</td>
<td>Ītlangā</td>
<td>Ītilgiou</td>

<td>Dalung</td>
<td>Dalanga</td>
<td>Dalungīou</td>
</tr>
<tr>
<td>Theirs</td>
<td>Ltha</td>
<td>Lthanga</td>
<td>Lthāgiou</td>
</tr>
</tbody>
</table>

The two series of possessives in Table 3 seem to be reflected in Harrison's grammar by the definite and reflexives. The general Dī is retained in Hydaburg, though the other forms seem to have merged with contracted definite forms. Certain questions remain regarding the choice of one series over the other and further research will be necessary for a complete analysis. Forms such as lagia, seem to be morphologically complex, and may contain a possessive particle gia.

(63) lagia nai  
His (their) house.

These forms always precede the nouns they possess.

In the other series there appears to be a general shortening of both Swanton's and Harrison's forms, except for dīnā which remains distinct from dī. This latter form is used with parts of the body, kin terms, and inalienable possessions.

(64) nai dīnā  
My house is burning.

(65) nai da  
Your (sing.) house is burning.
(66) nai la hagena
His (their) house is burning.

(67) hai ik stungan
We have two dogs. (lit. Our 2 dogs)

hai (dog) stungan (two)

To indicate possession of plural count nouns where plurality is expressed numerically, the form of (67) is very frequent.

Discussion

There are recognizable similarities between the Harrison grammar of Masset and current Hydaburg speech. To a somewhat lesser extent this is the case with Swanton's pronoun data for Masset. This suggests that while there is an unmistakably close relationship between Masset Dialect (ca. 1900) and Hydaburg Dialect as presented here, there may have been independent development.

From Swanton's analysis it would appear that an incipient emphatic series of active pronouns was represented solely by the 2nd person singular da. By contrast, Harrison, whose analysis preceded Swanton's, notes the existence of a full series of pronouns (Table 2, Series A) cognate if not identical to the emphatic series presented here. He suggests that the two are interchangeable. If focus was marked by pronouns and word order in Harrison's time it is surprising that he fails to note it, especially since so much of his analysis is exceptionally detailed.

The 1st plural forms still pose questions for further research but suggest a temporal trend toward reduced forms (i.e. t3el for t?alun). The 2nd plural form is now reduced to lu from dalung. There seems to be a complete shift away from distinctive 3rd person plural forms, in favor of a 3rd person pronoun whose number is
aspectually marked.

There has been a general streamlining of forms in the possessive series.

Danga → da (your sing.)

laña → la (his)

The absence of a 2nd plural possessive noted by Swanton seems to persist.

We may conclude that dialectal differences cannot be demonstrated without recent data from Masset. But there have been significant developments in the various pronoun series since the researches of Harrison and Swanton.

Note

I wish to acknowledge the much appreciated assistance of Bertha George of Seattle. Materials collected by Carol M. Eastman and Paul K. Aoki in 1972 have also been used in the analysis. Advice and criticism has also been received from J. Daniel Vaughan, Carol M. Eastman, and Elizabeth Edwards.
